

SONOGRAPHER TIPS AND TOOLS FOR FETAL ARRHYTHMIA EVALUATION

Objectives:

- * IDENTIFY ABNORMAL HEART RATES AND RHYTHMS**
 - * CREATE A "TOOL BOX" FOR ARRHYTHMIA ASSESSMENTS**
 - * HELP SONOGRAPHERS OBTAIN DIAGNOSTIC IMAGES FOR INTERPRETATION**
-

Embryology

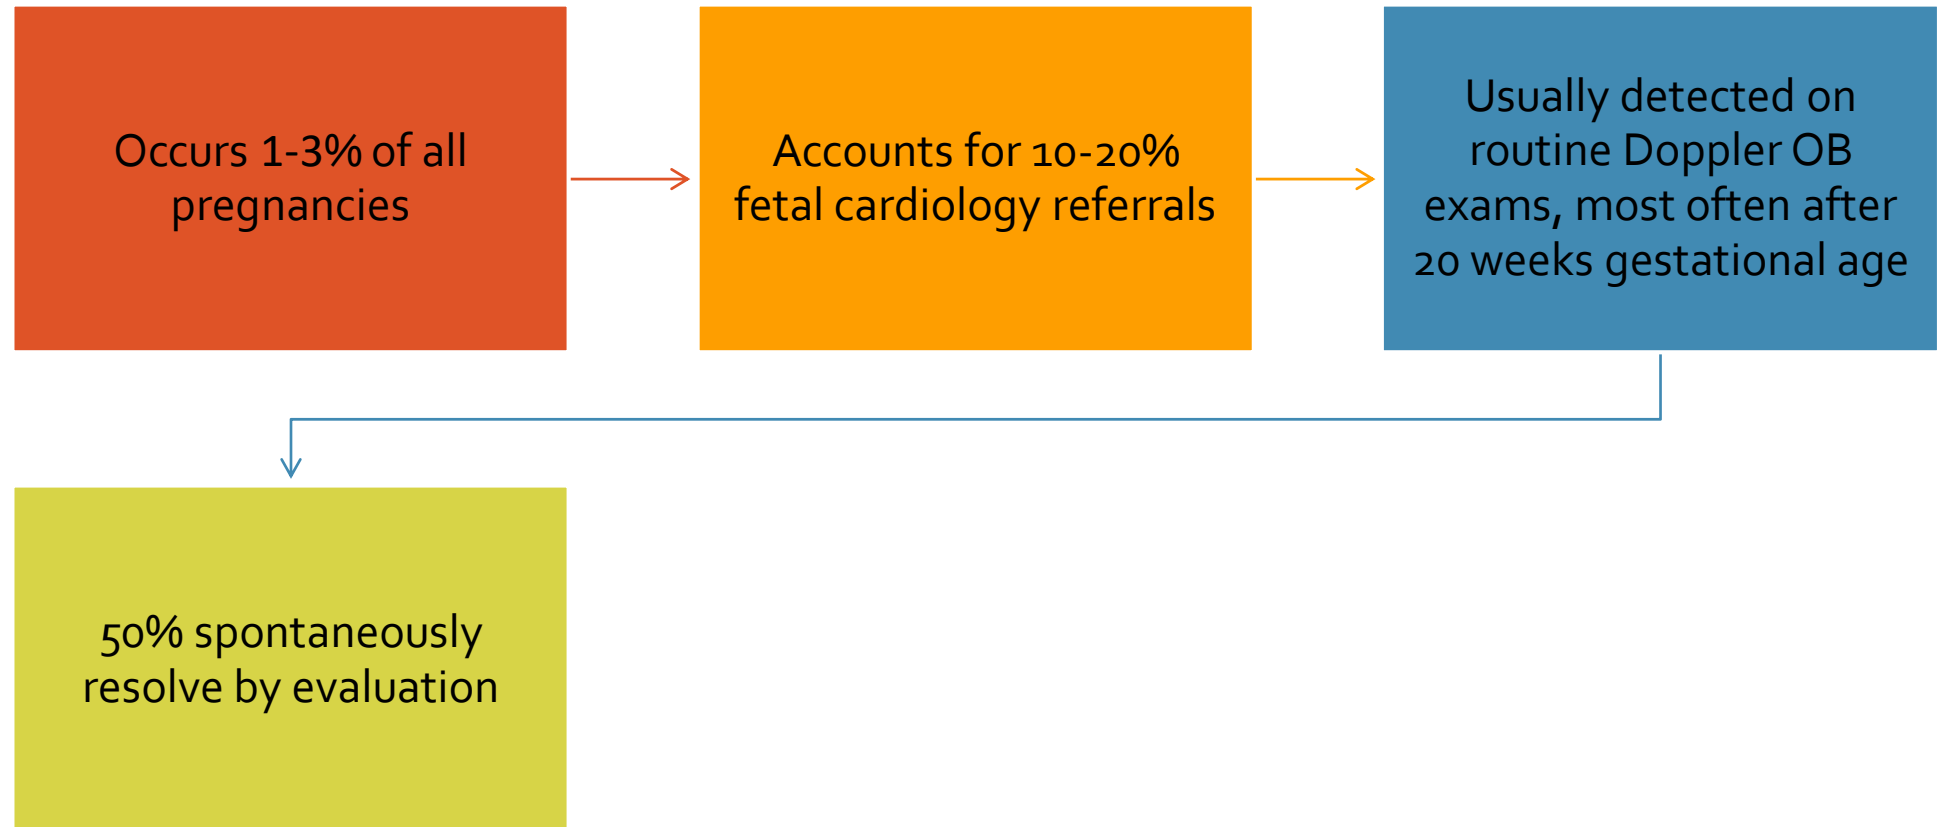

Heart beats as early as 12 days gestation!

By 6 weeks post conception, AV synchrony can be demonstrated

Normal fetal heart rates are age dependent

- 6 weeks- 100bpm
- 9 weeks- 170bpm
- 14 weeks- 150bpm
- 20 weeks- 140bpm (usually time at which we see them)
- Beat to beat variation may range 5-15bpm

Fetal Arrhythmia Background

Mental preparation for sonogram:

Fetal well-being?

Structural defects/mother's history?

Obtain information for diagnosis of rhythm

Fetal Well Being

Hydrops present, pleural effusion/pericardial effusion?

DV flow- retrograde flow seen?

UV pulsations (not related to breathing)

Good systolic ventricular function

AVVR- TR?

CT ratio increased?

UA/MCA PI less than 1 (decreased CO)?

Structural Causes of Fetal Arrhythmias

Structurally normal heart

- SVT
- *PAC's, PVC's

Tumors or ventricular/atrial wall defects

- Rhabdomyoma
- Atrial septal aneurysm* - PAC's

CHD

- Ebstein's anomaly-SVT
- Heterotaxy- all levels of SA/AV nodes tachyarrhythmias
- CCTGA-* CHB
- Left atrial isomerism *CHB
- Pulmonary Atresia
- Previous child with CHB

Autoimmune diseases/Viral Infections

Sjogrens syndrome- SSA/SSB+ (most common
seen as arrhythmias in category)

Myocarditis

Thyrotoxicosis

Phenylketonuria

Rubella

Inherited Channelopathy/Maternal Medications/diet

LQTS *

Short QT syndrome

Brugada syndrome

Catecholaminergic polymorphic ventricular tachycardia/CPVT

Beta-adrenergic blocking agents(propranolol,metoprolol)

Caffeine intake

Cardiac Conduction System

FETAL CONDUCTION SYSTEM

Fetal Arrhythmia Evaluation- No ECG!

- ECG is gold standard to assess direct measurement of electrical signals.... fetal echo is an indirect assessment by mechanical events-contractions associated with electrical signals

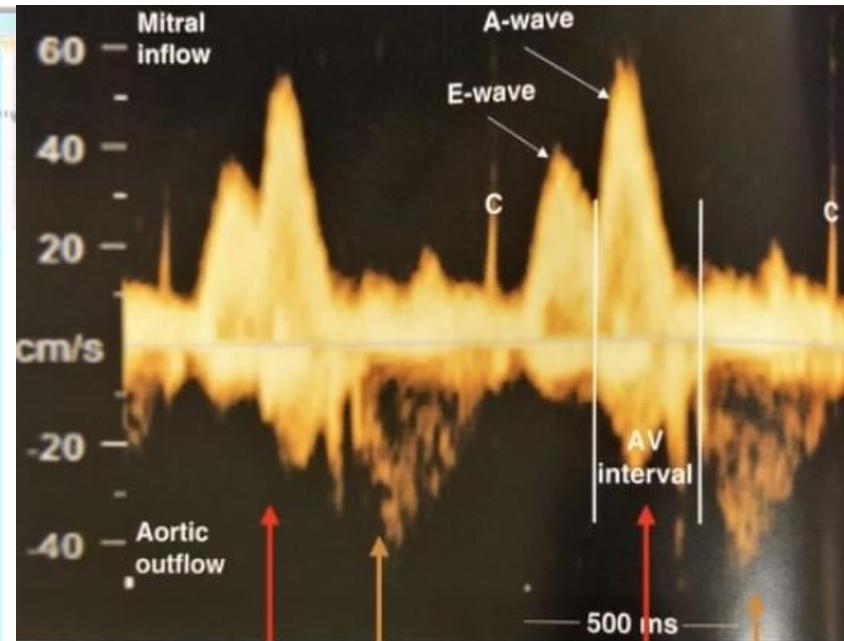

How to assess?

- 2D- visually categorize
- M-Mode and Doppler!
- M-Mode: through atria and ventricle
- PWD: LVOT inflow/outflow, SVC/AO, PA/PV

- The impulses are slowed at the AV node.
- This slowing corresponds to the PR or AV or mechanical PR interval
- If the AV node is abnormal, impulses are delayed (1° AV block), intermittently or not at all conducted (2° and 3° AV block)

Step by Step

1st: What is the fetal HR (slow, fast, irregular

2nd: What is the atrial to ventricular relationship?
(1:1 conduction or more atrial to ventricular or
more ventricular to atrial contractions)

3rd: What are the AV/VA time intervals? (long,
short, or all short, all long)

Step 2: Determining the A/V relationship by M-Mode

- AMM curser - RA wall tends to help with atrial assessment, so RA/LV
 - *Coronal view best, 4-Ch can be used, RA-RV in sagittal view
 - There is a "dot" on the curser which helps the area of interest
 - Anatomical M-Mode is your friend- 45 degree angle is best
- Decrease sweep speed watch and leave it on to catch rhythm
- Can measure A-V time and V-A time, A-A rate V-V rate
- Limitations, fetal movement, breathing, hiccups, hydrops, & poor windows

Step 2: M-Mode

M-Mode

M-Mode

M-Mode

Step 3: Doppler assessment

- SVC/AO interrogation
 - Increase sample gate- 4
 - wall filter around (120Hz)
- LVOT inflow /outflow interrogation
 - Increase sample gate
 - wall filter (120Hz)
- Pulmonary vein and Pulmonary artery interrogation
 - Show pics of SVC/AO and LVOT / PV/PA and ask what is being measured

SVC/Innominate/AO

Mechanical PR interval

- 3V view and sagittal view with Innominate Vein and Aorta

LVOT Inflow Outflow Doppler

Mechanical PR interval

Pulmonary Vein/Pulmonary Artery-

Mechanical PR interval

What Do You See? – 2D Assessment

Atrial Flutter (close to 500)

What Do You See?

SVT

SVT

SVT

SVT

What Do You See?

CHB

What do you see? (CHB)

What Do You See?

What do you see?

PVC's and possible Bigeminy

What do you see?

What Do You See? 2D Assessment:

PAC's Non Conducted and Conducted

PAC's

Bonus points:

What arrhythmia is most commonly seen in this video?

Summary

- Follow the routine 2D imaging standards
- Include M-Mode assessment of atrial and ventricular wall motion
- Include LVOT/AV Doppler for mechanical PR interval
- Sample a parallel artery/vein
- Stay calm, focus on one thing at a time!

If this doesn't give your heart a smile and a little fast rhythm.... not sure what will. :)
